Explore Escapes

Introduction

- **Define/Describe your project.**
  Explore Escapes is a cutting-edge online platform created to meet the desires of travel lovers and thrill-seekers. The goal of our project is to offer users a vast collection of travel destinations, thrilling activities, and tailored suggestions according to their preferences. The platform will provide tools like searching for destinations, booking activities, reading user reviews, and creating a comprehensive travel planning experience.

- **Why do you like to do this project/the benefits of doing this project?**
  We selected this project because it merges our love for traveling with our expertise in web development. In recent years, the travel sector has experienced noteworthy expansion, leading to an increased need for platforms providing complete travel planning solutions. Our goal in creating Explore Escapes is to meet this demand and offer users a smooth and pleasant travel planning process. The project will enable us to improve our abilities in web development, database management, and user experience design, increasing our competitiveness in the job market.

Design and Data Flow

UX Design:

We have designed a Hi-fi model using Adobe XD for Wireframes. In our Wireframe we designed 5 pages which are (**Attaching the XD Files for Hi-fi Wireframes as a separate file in the submission folder)**

1. **Home**
   On our Home page, we offer a summary of Explore Escapes, inviting you to start memorable adventures, whether you are looking for peaceful beaches, lively

cityscapes, or secret gems. Discover your upcoming trip with us, as we turn your travel dreams into reality. Our services include all aspects of your journey, from discovering locations to securing lodging, transportation, sightseeing, and additional services. Discover our office sites and amenities aimed at improving your journey. Become part of our happy customers who provide their feedback and allow us to turn your travel desires into a reality.

2. **Accommodation**

   The Accommodation section on Explore Escapes has a neat and orderly design with a top banner that includes links for navigation and user functions such as Sign Up and Sign In. An important banner image and search bar assist users in locating accommodations according to destination, dates, and number of guests. Information is presented through image cards and short descriptions in categories such as Popular Destinations, Accommodation Property Types, and Cost of Accommodation. An invitation to subscribe prompts users to register for exclusive offers. The bottom section offers extra ways to navigate and contact.

3. **Transportation**

   The Transportation section on Explore Escapes includes a top section with links for navigating and options to sign up or log in. Users can search for taxi services by inputting their pick-up location, date, and time into the prominent search bar. Logos and provider names are shown for well-known taxi services. Short sections discuss Customer Service, Cancellation policies, and Reviews. An FAQ section enables users to select questions in order to uncover answers, providing improved support.

4. **Attractions**

   The Attractions section on Explore Escapes' website features a header containing navigation links and activities for users. The introduction section includes a title and short description of the attractions. Six different attractions are showcased in

labeled "Attraction" placeholders. When you click on a specific attraction, you will see its information and a picture displayed underneath. The footer provides extra links and details.

5. **Contact Us**

   Contact Us page includes a navigation bar, a banner with a heading, and a map displaying the closest office. It contains a contact form where users can submit messages, by filling their name, email, subject, and message.

Dataflow and ER Diagrams:

(**Attaching the Dataflow & ER diagrams as a separate file in the submission folder)**

ER Diagram:

We used MongoDB database to store user information, transportation details, destination details, attractions & activity listings, details of accommodations, user reviews. The ER diagram will include entities such as Location, Hotel, Rooms, Reservations, Vehicles, etc., with relationships defined between them.

Block Diagrams for Dataflow:

A visual representation will show how data moves between React (front-end), Node.js/Express (back-end), and MongoDB (database). Information will move from user engagements on the interface to the backend, where it will be handled and saved or fetched from the database as required.

Technology Description

MongoDB:

We selected MongoDB as it has ability to manage unstructured data effectively, as well as its scalability and user-friendly nature when working with JSON-like documents, which makes it a good option for storing various travel-related data. The lack of a fixed schema enables easy

incorporation of different data types, perfect for constantly changing travel databases. Furthermore, MongoDB's ability to scale horizontally effectively handles increasing amounts of data and user needs.

React:

Chosen for its structure based on components, enabling the creation of a user interface that is interactive and adaptable. react's virtual DOM guarantees effective updates and rendering, improving user experience.

Node.js:

Node.js is a platform where developers can utilize JavaScript on the server-side, enabling effective and scalable server-side coding, making it perfect for creating quick and compact server applications. Node.js, paired with Express, will handle the back-end operations, overseeing API requests and database operations.

Market Survey

As per our research on current job posting with requirements to become a Full Stack Developer in an esteemed organization.

Following top technical skills are required.

1. React.js
2. Node.js
3. MongoDB
4. Express.js
5. Advanced JavaScript (ES6+)
6. HTML5
7. CSS3
8. RESTful APIs
9. GitHub
10. Agile/Scrum Methodologies
11. Adobe XD for UX Deign

This survey validates that the technologies selected for our project are very pertinent and will improve our chances of getting a job after we graduate.

Conclusion

The Explore Escapes project will progress throughout the semester, with important milestones to achieve.

- Designing and planning in the beginning stages: Weeks 1-2.
- Weeks 3-6 of Front-End Development.
- Weeks 7 to 10 focus on Back-End Development.
- Integration and Testing of Databases: Weeks 11-14
- Testing and Deployment will be completed in the final two weeks of the project, which are Weeks 15-16.
